Definition of Environmental Indicators (for the RCRA Corrective Action)

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are nearterm objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

Duration / Applicability of EI Determinations

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "**contaminated**" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	<u>Yes</u>	<u>No</u>	?	Rationale / Key Contaminants
Groundwater	X			Ongoing groundwater remediation.
Air (indoors) ²		X		Meet OSHA requirements
Surface Soil (e.g., <2 ft)		X		Contaminated soil excavated
Surface Water		X		No record of contamination
Sediment		X		Contaminated sediment excavated
Subsurf. Soil (e.g., >2		X		Contaminated soil excavated
ft)				
Air (outdoors)		X		Emission controls in place

If yes (for any media) - continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

If unknown (for any media) - skip to #6 and enter "IN" status code.

Rationale and Reference(s):

General Info.: On December 28, 1998, STC agreed to implement remediation pursuant to the Corrective Measures Implementation Consent Order. The remediation consists of soil excavation, groundwater pump and treat, in-situ soil vapor extraction, and closures of solid wastes management units. STC has implemented the remediation and will continue to conduct groundwater and soil vapor extraction monitoring to ensure that remediation systems are in proper order.

Groundwater: As part of the ongoing remediation, Superior Tube Company (STC) will continue to monitor and remediate the groundwater plume, which consists predominately of trichloroethylene (TCE). TCE detections in groundwater range from 0.9-50 mg/L. (2001 Annual Groundwater Report)

Surface and Subsurface Soil: Contaminated soils have been excavated and disposed off-site. The excavated areas were backfilled and the areas were either re-seeded or paved over. (*Corrective Measures Implementation Report*, 2002)

Air (outdoors): Air emission equipment are in place to minimize volatile organic compounds (VOCs) emissions from the facility manufacturing operations. (*Corrective Measures Implementation Report*, 2002)

Air (indoors): The facility uses numerous VOCs, especially TCE as part of their manufacturing process. As part of the OSHA's requirement for the manufacturing buildings, the facility installed monitor and ventilation systems to ensure that indoor VOC levels do not exceed human health threshold levels. (*RCRA Facility Investigation Report*)

Sediment: Under the Corrective Measures Implementation Consent Order, contaminated sediment near the facility outfalls was excavated and disposed off-site. (*Corrective Measures Implementation Report*, 2002)

Surface water: No record of contamination. The facility is in compliance with the National Pollutant Discharge Elimination System (NPDES) at the facility's outfalls. The groundwater plume is limited to subterranean boundaries and does not discharge to the nearby creek. (*Corrective Measures Implementation Report*, 2002)

Footnotes:

^{1 &}quot;Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table Potential **Human Receptors** (Under Current Conditions) Residents Workers Day-Care Construction Trespassers Recreation Food³ "Contaminated" Media Groundwater No No No No No Air (indoors) Soil (surface, e.g., <2 ft) Surface Water Sediment Soil (subsurface e.g., >2 ft) Air (outdoors) **Instructions for Summary Exposure Pathway Evaluation Table:** 1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated" as identified in #2 above. 2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway). **Note:** In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("___"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary. If no (pathways are not complete for any contaminated media-receptor combination) skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways). If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation. If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6 and enter "IN" status code.

Rationale and Reference(s): Pursuant to the 1998 Corrective Measures Implementation Consent Order, STC implements semi-annual groundwater monitoring and continuous groundwater remediation at the site. Offsite residents who are impacted by the groundwater plume have been identified and were either connected to public water or a dual carbon filtration system was installed in the homes to treat the groundwater. With regards to the onsite groundwater plume, the facility has a treatment system in place to remediate the groundwater. Potential onsite and offsite human exposures are under control. (*Corrective Measures Implementation Report*, 2002)

²Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

³ Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

4.	Can the exposures from any of the complete pathways identified in #3 be reasonably expected to be " significant " (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps even though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?				
	—— "ເ ວດ (f	no (exposures can not be reasonably expected to be significant (i.e., potentially unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status ode after explaining and/or referencing documentation justifying why the exposures from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."			
		yes (exposures could be reasonably expected to be "significant" (i.e., potentially unacceptable") for any complete exposure pathway) - continue after providing a escription (of each potentially "unacceptable" exposure pathway) and explaining and/or ferencing documentation justifying why the exposures (from each of the remaining emplete pathways) to "contamination" (identified in #3) are not expected to be significant."			
	If	unknown (for any complete pathway) - skip to #6 and enter "IN" status code			
	Rationale and Refe	rence(s):			

⁴ If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

	If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing <u>and</u> referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).
	If no (there are current exposures that can be reasonably expected to be "unacceptable")-continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.
	If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code

5.	Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):						
	<u>X</u>	YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Superior Tube Company facility, EPA ID # PAD 00 235 3407, located at 3900 Germantown Pike, Evansburg, PA 19426 under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.					
		NO - "Current Human Exposures" are NOT "Under Control."					
		IN - More information is needed to make a dete	ermination.
